No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                              556.2

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC expression vector contains a cDNA encoding human placental alkaline CC expression vector contains a cDNA encoding human placental alkaline CC phosphatase (AP, see w55047) lacking a slygnal sequence. When CC phrap3 is transfected into a mammalian cell line, such as COS7 CC cells, AP protein is neither expressed nor secreted since the AP CC cDNA of ptrAp3 does not encode a signal peptide or a membrane CC anchor sequence. However, insertion of a cDNA encoding a signal CC peptide sequence into ptrAp3 facilitates the expression and CC secretion of AP upon transfection of the DNA into mammalian cells. CC The presence of AP activity in the supernatants of transfected CC cells therefore indicates the presence of a signal sequence in the CC cDNA of interest. This forms the basis of a novel method for the CC cDNA of interest. This forms the basis of a novel method for the CC consecution of genes encoding novel proteins having a signal CC sequence, i.e. secreted or membrane-associated proteins of CC designated ethb0018f2, was isolated clone (see V27707), CC designated ethb0018f2, was isolated using the novel method and CC encodes a human neural adhesion protein (see W55045) protein having CC antitiple, consecutive IGG domains. The method is very sensitive CC antermation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches 656;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                       This DNA sequence comprises the HindIII/XhoI fragment of the CC SR alpha enhancer/promoter in plasmid pobl-SR alpha 296. The SR alpha enhancer/promoter is composed of human T cell leukaemia CC virus 1 5 untranslated sequences and the SV40 enhancer. It is creported to increase expression from the SV40 enhancer/promoter by C10-fold in host cells, and is active in a broad range of cell types. The SR alpha enhancer/promoter has been utilised in CC expression vectors designed for efficient expression of genes in cultured cells. The invention provides vectors and improved methods for the expression and co-amplification of genes encoding recombinant proteins in cultured cells. The methods permit the classification of cell lines which have co-amplified input recombinant sequences which encode an amplifiable marker, one or more expression vectors encoding a protein of interest and optionally a selectable marker. The amplified cells provide large quantities of recombinant proteins suitable for immunotherapy for treatment of custom vaccines, including multivalent vaccines that reflect the constant constant variation found in a patient's tumour.
                                                                                                                                                                                                                                                                                                                                                                                                Multivalent vaccine to treat B cell lymphoma or leukaemia comprises at least 2 different recombinant variable region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             06-DEC-1996;

The vectors which comprise a gene which can induce apoptosis under specific conditions, e.g. guanine phosphoribosyltransferase (gpt)), or a reporter gene, e.g. luciferase, where the gene is situated downstream of a promoter which responds to specific extracellular stimulation such as the presence of a cytokine, e.g. tumour necrosis factor (TNF) or interleukin-1. The vector may be used to transform a suitable cell line, such as a cell line which does not produce hypoxanthine-guanine phosphoribosyl transferase (HGPRT). The transformed cells are used to test the inhibitory effect of a gene or substance on intracellular signal transmission.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  reporter gene and promoter sequence, potential anti-inflammatory agents

This sequence is used in a plasmid for regulation of gene expression, and treatment of viral infection pref. human T-cell leukaemia and HIV. The plasmid also encodes a protein which is used as an antivirus agent, and also in a method for detecting cancer. The DNA molecule and protein have potential uses in gene therapy, and the plasmid may also have potential use in the treatment of TSP.

                                     Diagnosis of human leukaemia and/or lymphoma and virus infection made with part or all of the recombinant DNA. Virus antigenic proteins can be produced. These peptides and proteins, and antibodies against them, are useful for the diagnosis, therapy ar prevention of human leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Key

Particularly preferred target genes are those coding for the ENV, POL, GAG proteins. Antisense sequences may also target the ART and TAT splice sites, the region around the translation initiation codon (AUG) or the primer binding site (PBS) of the retrovirus. The method is especially intended to confer resistance to infection by human immunodeficiency virus (HIV), feline leukeemia virus (FELV) or human T lymphotropic virus i (HTLV-I). This sequence is from the long terminal repeat of HTLV-I and represents a target for inhibitory nucleic acid of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in 068397-99 represent fragments of the HIV, HILV-1 and reLV genomes which include the long terminal repeats (LTRs). These sequences which include the long terminal repeats of the invention. The method confers resistance to retroviral infection upon a host cell by inhibiting at least one step in the infection process, esp. retroviral replication, reverse transcription, and translation. A polynucleotide is introduced into the host cell and transcribed. The polynucleotide is complementary to a region of the retroviral genome selected from the 37-region, the primer binding site, the AUG start codon region and the RNA splice sites. This method can be used to prevent and to treat
                                 HIV: human immunodeficiency virus; antisense; replication inhibitor; infection resistant; retrovirus; lymphotropic disease; viral leukaemia; lymphadenopathic; HTLV-I; human T-cell lymphotropic virus type I; AIDS;

Antisense oligonucleotides against these polynucleotides are used in a method for conferring resistance to retroviral infection on a host cell. The antisense sequences are transfected into the host cell to prevent viral replication by binding to a site important for this process, e.g. the LTR, PBS (primer binding site). R region (essential for the "first transfer the transfer that the t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             (Q50835) shows cDNA prepared from RNA extracted from a HTLV-1 infected cell. This was amplified by PCR and was used to construct p21x cDNA (Q50835). Primers and probes were then manufactured (Q50837-43), these are useful for the detection of HTLV-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Oligo-nucleotide primer - for detecting mRNA of human leukemia virus 1 by polymerase chain reaction
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    HTLV-1; human T cell leukemia virus;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   (Q50835) shows cDNA prepared from RNA extracted from a HTLV-1 infected cell. This was amplified by PCR and was used to construct p21x cDNA (Q50836). Primers and probes were then manufactured (Q50837-43), these are useful for the detection of HTLV-1 infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Oligo-nucleotide primer - for detecting {\tt mRNA} of human leukemia virus 1 by polymerase chain reaction

No ORF has yet been conclusively identified within the present sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and decreation vertexes.

The backbone of the plasmid is from pUC19. pWRG3139 induces at least twice the expression of II-12 as the bicistronic vector pWRG3196 (see VU2043) in vivo and in vitro. A novel method of treating tumours in a mammal involves delivering copies of an expressible foreign genetic construct, especially pWRG3169 or pWRG3196, comprising a promoter operative in the mammalian epidermal cells and DNA sequences encoding p35 and p40 subunits of II-12 to target cells in vivo. Delivery of the construct allows II-12 expression for treatment of solid, metastatic or disseminated tumours, and regression of established tumours. The treatment is effective even when the genetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CDS

                                                                                                                                                                                                                                                   Matches 189;
                                                                                                                                                                                                                                                                                                                                                         protein (GFP) coding sequence. The invention relates to a non-human transgenic animal having a reporter gene coupled to a skin metabolism promoter. The transgenic animal can be used in a method for evaluating a treatment for its effect on skin. The method, together with the transgenic animal are useful for evaluating a compound for its effect on the health or appearance of the skin. The method enables rapid and efficient evaluation of compounds for their effect on skin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  This sequence represents a construct containing the matrix metalloproteinase 9 (MMP9) promoter linked to the green fluorescent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Transgenic animal having a reporter gene coupled to a skin metabolism-related promoter
